## Problem

I want a place to store all the settings for my guitar setup across different songs. The knobs and switches and what is on.

## Solution

I am going to build a small HTML project with JSON to store the values of the knobs. It will use SVGs for the knob display and UI.

| | **Urgent** | **Not Urgent** |
|---|---|---|
| **Important** | **Do - (Your MVP)**<br>● JSON file with 2 or 3 songs<br>● Sidebar with song titles<br>● Click a song to load it's settings<br>● SVG knobs rotated to their saved values<br>● On/off display for pedals<br>● Pickup selector display<br>● Devices in chain order | **Schedule - (For V2.0+)**<br>● Better pedal display / UI<br>● Form to easily add/edit songs<br>● Save changes<br>● Import/export JSON file<br>● Search songs<br>● Multiple settings per song<br>● |
| **Not Important** | **Delegate - (Use a library)**<br>● JSON loading<br>● Fonts | **Delete - (Cut it)**<br>● Spotify integration<br>● App |

| | | |
|---|---|---|
| | • JSON validator<br>• | • |

## Tech Stack

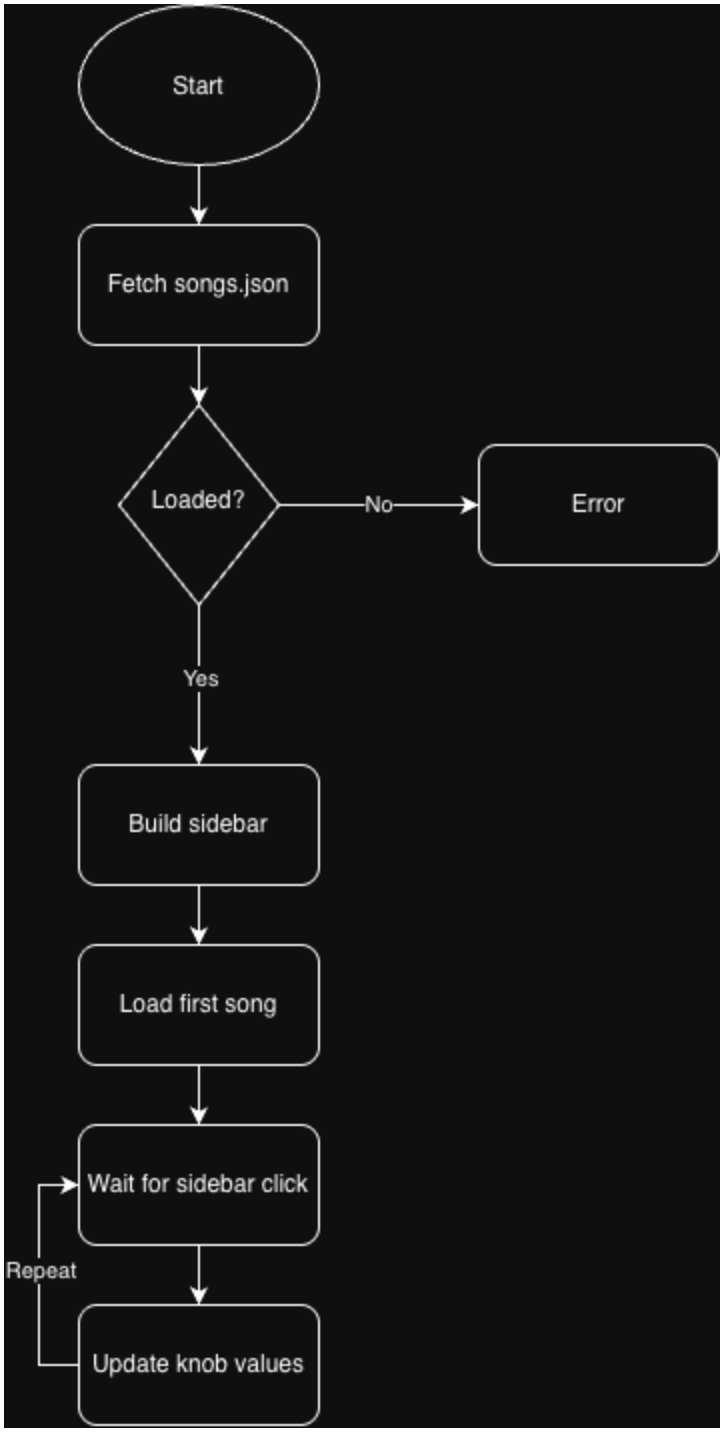

What language are you writing in?
HTML/CSS/JS

What libraries, packages, or external tools do you need? If you're writing Bash, which commands or utilities will you rely on curl, grep, jq, cron, etc.)? If you're writing Java, which external libraries (if any) do you need?
Python's http server, google fonts, JSONLint

How will you store data? For an MVP, a plain text / JSON / CSV file is often enough, so there's no need to jump to a full database.
JSON

## Build Plan

1. Set up repo
2. Write the settings data
3. Load the data
4. Build the song side bar
5. Draw SVGs and UI
6. Render a panel with correct knob positions
7. Connect sidebar to the UI
8. Polish and finish and edge cases

Start
Fetch songs.json
Loaded?
No
Error
Yes
Build sidebar
Load first song
Wait for sidebar click
Repeat
Update knob values
